

SCENEMASTER

HO Scale Kit **OIL DRUMS (32-PACK)** 949-4152

Thanks for purchasing this Walthers SceneMaster™ kit, all parts are molded in styrene plastic, so use compatible cement and paint to assemble and finish your models. Please take a moment to read these instructions and study the drawing before starting construction.

One of the most versatile of all shipping containers, the standard 55-gallon (200l) drum appeared in the early 1900s as a more durable and leak-proof container than similar barrels then in use to ship various petroleum products. With some improvements in the basic design over the years, steel drums have been adapted to the needs of many different industries, as the standard size allows for easy stacking or loading and handling on pallets; some are also strengthened with raised rings allowing them to be tipped on edge or completely on their side and rolled into place. Still used for a wide range of petroleum products yet today, steel drums like these can also be found safely transporting hazardous materials, chemicals of all types and some foodstuffs.

1) Parts in this kit are molded in different colors and like the prototypes, you can mix and match pieces, or build solid color barrels as desired.

2) Each barrel consists of three pieces; assemble by gluing two Ends (#421) to a Center (#422) as shown.
